

# Sketch Engine for Terminology

Miloš Jakubíček

Brighton, UK & Brno, CZ

`milos.jakubicek@sketchengine.co.uk`

November 6, 2015

11th International Conference on Terminology and Artificial Intelligence

University of Granada

Where we are  
&  
Where we go

# Sketch Engine

- corpus management system
- web service (including API)
- platform for providing language resources
- widely used for
  - lexicography purposes
    - Harper Collins, Oxford University Press, Cambridge University Press, Macmillan, . . .
  - linguistic and language technology teaching and research at universities
    - more than 100 academic institutions worldwide
    - dozens of thousands of individuals
  - language modelling (IT/LT companies)

# Sketch Engine features

- **concordancing**, sorting, sampling, wordlists, collocation lists
- full **regular-expression** searching
- support for **parallel corpora**, virtual sub- and supercorpora
- handles **billion-word (80 G+)** corpora smoothly
- **word sketches**: one-page summaries of a word's grammatical and collocational behaviour
- distributional **thesaurus**
- **keywords** extraction, **terms** extraction
- **Corpus Architect**: user corpora
  - uploaded by users
  - created by WebBootCaT

# Concordance search

**Concordance**

**Word List**

**Word Sketch**

**Thesaurus**

**Find X**

**Sketch-Diff**

**Sketch-Eval**

**Corpus Info**

?

---

**Save**

**View options**

**KWIC**

**Sentence**

**Sort**

**Left**

**Right**

**Node**

**References**

**Shuffle**

**Sample**

**Filter**

**Overlaps**

**1st hit in doc**

**Frequency**

**Node tags**

**Node forms**

**Doc IDs**

Query **colour** **16,486** (147.0 per million)

<b>J2L</b>	It would be tedious to list the types and	<b>colours</b> of stone, ceramic etc. used at each site	
<b>J2L</b>	types of stone used for various shades of	<b>colour</b> are predictable and limited in number.	
<b>J2L</b>	Birdcombe Avon. Here, sandstone furnished a buff	<b>colour</b> , pennant stone a blue, liar the white for	
<b>J2L</b>	most mosaics comprise three to six basic	<b>colours</b> , a work of good quality will include many	
<b>J2L</b>	therefore, to note ten or twelve different	<b>colours</b> of tesserae in one pavement. In some, such	
<b>J2L</b>	the Woodchester Orpheus mosaic. </p> 3.2 The	<b>colour</b> of Tesserae <p> Sensitive use of shading	
<b>J2L</b>	1976, 9). Elsewhere, intelligent use of	<b>colour</b> is responsible for the blue shading which	
<b>J2L</b>	are notable. </p><p> Whilst considering the	<b>colour</b> of tesserae it is also pertinent to mention	
<b>J2L</b>	: 0.5 cm. sq. and 1.5 cm. sq. </p><p> Like	<b>colour</b> , the size of the tesserae affects the perspective	
<b>J2L</b>	fairly dark tesserae (deep red is a favourite	<b>colour</b> ), so producing a stronger" proximity effect	
<b>J2L</b>	panels (pl. 5b). At Leicester the rosettes -	<b>coloured</b> (from the edges inwards) red, yellow and	
<b>J2L</b>	be cramped (although" loose"). There are	<b>colour</b> contrasts however: the simple guilloche	
<b>J2L</b>	former. However, the-more subtle use of	<b>colour</b> in the latter also produces a less contrived	
<b>J2L</b>	angular appearance. An overall poverty of	<b>colour</b> , and the use of slightly larger (but still	
<b>J2L</b>	mosaic A). Although including the same basic	<b>colours</b> , as well as tesserae of a similar size,	
<b>J2L</b>	blending of many tones of five or six basic	<b>colours</b> , is notable in both designs. It is a sensitivity	
<b>J2L</b>	shows a generally consistent interface of	<b>colour</b> , one in every four tongues of the latter	
<b>J2L</b>	Oceanus panel (contrast the confusion of	<b>colour</b> around the heads of the lion and stag)	
<b>J2L</b>	However, on balance, the use here of similar	<b>colours</b> (red, yellow, grey, pale-blue, brown) and	
<b>J2L</b>	Street mosaic, the presence there of a richly	<b>coloured</b> figured panel (enclosed by a chain-guilloche

# Sketch Engine languages

By June 2015 more than **400 corpora** for **82 languages**:

- 100+ corpora having more than 100 million tokens
- 30+ corpora having more than 1 billion tokens
  - In 2010 a series of TenTen ( $10^{10}$ ) corpora started
- 60+ languages with a PoS-tagged corpus
- 42 languages with word sketches
- 26 languages with integrated tagger for tagging user corpora
- parallel corpora: EUROPARL, DGT, OPUS, ...

# Users

- Lexicographers
- Researchers
- Teachers
- Language Learners
- Translators
- Terminologists
- Copywriters

# Sketch Engine – where we go

- = Sketch Engine after Adam Kilgarriff
  - more questions than answers, of course

# Research Agenda in a Nutshell

- Building Very Large Text Corpora from the Web
- Parallel and Distributed Processing of Very Large Corpora
- Corpus Heterogeneity and Homogeneity
- Corpus Evaluation
- Corpora and Language Teaching
- Language Change over Time
- Corpus Data Visualization
- Terminology Extraction

# Building Very Large Text Corpora from the Web

- well-studied domain
- but many ongoing challenges including:
  - text type identification (genres on the web)
  - spam fighting
  - text normalization and cleaning
  - dealing with low-resourced languages
  - diachronic analysis (timestamping)

# Parallel and Distributed Processing of Very Large Corpora

- targeting corpus size of ca 100 billion words
- trivial parallelization often not possible
- compile-time:
  - corpus virtualization
- run-time
  - asynchronous processing all over web pages
  - reimplementing of the database backend (Manatee) in Go language
    - native support for concurrency

# Corpus Heterogeneity and Homogeneity

- what is in the corpus?
- how is corpus X similar to corpus Y? ([link](#))
- assumes we know how much X and Y are homogenous
- text type induction, clustering, ...

# Corpus Evaluation

- is corpus X better than corpus Y?
  - assumes: better for a purpose
- 2012: collocation dictionary task (En, Cz)
  - word sketch evaluation
  - sketch grammar vs. parser comparison
  - ...
- next run of the task to come soon

# Corpora and Language Teaching

- biggest problem with Sketch Engine: *too many buttons*
- SkELL – <http://skell.sketchengine.co.uk>
  - English only
  - Russian coming very soon
  - more to come on demand

# Language Change over Time

- neologisms finding
- so far: new lexemes ([link](#))
- now: new/changed senses based on word sketches
- data is the problem, not the algorithms

# Corpus Data Visualization

- work by Lucia Kocincova
- to be integrated into Sketch Engine and continued
- [preview](#)

# Terminology extraction

Automatic terminology extraction

→ given a domain corpus, find all terms in it

Terms and Terminology

→ term as a concept is plausible only within a fixed domain

# Terminology extraction

Why use corpora for terminology extraction?

- to work faster
  - → allow people to focus on intellectually demanding tasks, leave the easy bits to computer
- to work better
  - → data-driven evidence instead of linguistic introspection

Terminology is a fast moving target.

# Terminology extraction

What is a “term”?

- unithood
  - which words form a grammatically well-defined unit?
  - → simplifying assumption: terms are noun phrases
- termhood
  - does it belong to the domain?
  - → keyword formula: ratio of relative frequencies in contrast to a general language corpus

# Unithood

## Recognizing noun phrases in corpora

- exploiting the Sketch Grammar formalism: CQL queries matching noun phrases

# Term grammar example: English

=terms

\*COLLOC "%(2.1c)\_%(1.1c)"

2: [tag=="NN" | tag=="JJ" | tag=="VVG"] 1: [tag=="NN"]

\*COLLOC "%(3.1c)\_%(2.1c)\_%(1.1c)"

3: [tag=="NN" | tag=="JJ" | tag=="VVG"]

2: [tag=="NN" | tag=="JJ" | tag=="VVG"]

1: [tag=="NN"]

# Term grammar example: German

```
=terms
```

```
define('adj', '[kind="ADJA"]')
```

```
define('subs', '[kind="N"]')
```

```
...
```

```
# kleines Haus
```

```
*COLLOC "%(2.adj_stem)%(1.gender_ending)_%(1.lemma_cap)-x"
```

```
2:adj 1:subs & 1.case = 2.case
```

# Termhood

- so called “simplemath” formula

$$\frac{f_f + N}{f_r + N}$$

- used for general keyword extraction
- varying  $N$  influences whether rare or frequent words are preferred

# Output example

Term	Frequency	Freq/mill	Score
carbon dioxide	<a href="#">373</a>	3864.3	37.5
global warming	<a href="#">317</a>	3284.1	30.8
water vapor	<a href="#">71</a>	735.6	8.3
greenhouse effect	<a href="#">69</a>	714.8	8.1
greenhouse gas	<a href="#">71</a>	735.6	8.0
climate change	<a href="#">78</a>	808.1	7.6
industrial ecology	<a href="#">27</a>	279.7	3.8
fossil fuel	<a href="#">26</a>	269.4	3.6
surface temperature	<a href="#">20</a>	207.2	3.1
carbon cycle	<a href="#">19</a>	196.8	3.0

## Languages covered (13)

- Chinese
  - Czech
  - Dutch
  - English
  - French
  - German
  - Italian
  - Japanese
  - Korean
  - Polish
  - Portuguese
  - Russian
  - Spanish
- Background: WIPO

# Demo: Iterative Building of Domain Corpora

- 1 bootstrap a corpus via WebBootCat – use seed words
- 2 extract terms, reuse them as seed words in step 1

# Challenges

- compatible focus and reference corpora
- lemmatization – word lemmas vs. term lemmas (French, Czech, German, ...)
- example: “klein Haus” vs. “kleines Haus”
- → new technical attributes (e.g. gender\_lemma)
- coverage vs. term grammar accuracy
- evaluation

# Bilingual Terminology Extraction

- given to parallel corpora
- find terms in both and align according to their translation
- now experimental in Sketch Engine, staged as technological preview
- [example](#)

# Terminology Checking

- given a translation and termbase
- can we check whether the translation uses the terms in a consistent manner?
- lots of linguistic processing needed (morphology)
- work in progress

# Integration with existing tools

- API available
- plugin development
- others, e. g. [Intelliwebsearch](#)
- *What?* – not *How?* is the question here

# Conclusions

- very many ongoing developments
- × but for now mainly: keep things going
- bringing corpora to masses
  - translators and terminologists
  - teachers and learners
  - more languages, more corpora, more tools
